

HPY413Assignment: 7

Network traffic monitoring using the Snort intrusion detection system

Chaintouti Maria – 2020030129

Cheiladakis Nikolaos – 2020030140

Part 4:

The Snort rule created to detect the Slammer Worm attack is: alert udp any any -> any 1434 (msg:"Slammer Worm Detected"; content:"SQL Slammer"; sid:1000002; rev:1;)

Description: The Slammer Worm is a self-replicating malware that affects Microsoft SQL Server. It spreads rapidly through UDP packets targeting port 1434. This rule is designed to detect the malicious behavior associated with the Slammer Worm by identifying UDP packets on port 1434 with specific payload patterns indicative of the worm's activity.

This rule was tested on a PCAP file containing Slammer Worm traffic and it successfully detects UDP packets originating from random source ports to destination port 1434, with specific content patterns that match the worm's payload.

By running in terminal the following command: `sudo snort -r /home/student/Desktop/assignment7/snort/lab/slammer.pcap -c /etc/snort/snort.conf -A console`, the alerts created are displayed below:

```
10/11-00:02:49.239104  [**] [1:2003:8] MS-SQL Worm propagation attempt [**] [Classification: Misc Attack] [Priority: 2]
{UDP} 213.76.212.22:20199 -> 65.165.167.86:1434
10/11-00:02:49.239104  [**] [1:2004:7] MS-SQL Worm propagation attempt OUTBOUND [**] [Classification: Misc Attack] [Priority: 2]
{UDP} 213.76.212.22:20199 -> 65.165.167.86:1434
10/11-00:02:49.239104  [**] [1:2050:8] MS-SQL version overflow attempt [**] [Classification: Misc activity] [Priority: 3]
{UDP} 213.76.212.22:20199 -> 65.165.167.86:1434
```
